## Question 1

Correct

Mark 1.00 out of 1.00

Given an listof integers, sort the array in ascending order using the *Bubble Sort* algorithm above. Once sorted, print the following three lines:

1. List is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
2. First Element: firstElement, the *first* element in the sorted list.
3. Last Element: lastElement, the *last* element in the sorted list.

For example, given a worst-case but small array to sort: a=[6,4,1]. It took 3 swaps to sort the array. Output would be

Array is sorted in 3 swaps.

First Element: 1

Last Element: 6

**Input Format**

The first line contains an integer,  $n$ , the size of the list  $a$ .

The second line contains  $n$ , space-separated integers  $a[i]$ .

**Constraints**

- $2 \leq n \leq 600$
- $1 \leq a[i] \leq 2 \times 10^6$ .

**Output Format**

You must print the following three lines of output:

1. List is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
2. First Element: firstElement, the *first* element in the sorted list.
3. Last Element: lastElement, the *last* element in the sorted list.

**Sample Input 0**

3  
1 2 3

**Sample Output 0**

List is sorted in 0 swaps.

First Element: 1

Last Element: 3

**For example:**

Input	Result
3 3 2 1	List is sorted in 3 swaps. First Element: 1 Last Element: 3
5 1 9 2 8 4	List is sorted in 4 swaps. First Element: 1 Last Element: 9

**Answer:** (penalty regime: 0 %)

```

1 x=int(input())
2 y=list(map(int,input().split()))
3 sort=0
4 for i in range(len(y)):

```

```
4 | for i in range(len(y)):
5 |     for j in range(0, len(y)-i-1):
6 |         if y[j]>y[j+1]:
7 |             y[j],y[j+1]=y[j+1],y[j]
8 |             sort+=1
9 | print("List is sorted in",sort,"swaps.")
10 | print("First Element:",y[0])
11 | print("Last Element:",y[-1])
```

	Input	Expected	Got	
✓	3 3 2 1	List is sorted in 3 swaps. First Element: 1 Last Element: 3	List is sorted in 3 swaps. First Element: 1 Last Element: 3	✓
✓	5 1 9 2 8 4	List is sorted in 4 swaps. First Element: 1 Last Element: 9	List is sorted in 4 swaps. First Element: 1 Last Element: 9	✓

To find the frequency of numbers in a list and display in sorted order.

**Constraints:**
 $1 \leq n$ ,  $\text{arr}[i] \leq 100$ 
**Input:**

**output:**

1 2

4 2

5 1

68 2

79 1

90 1

**For example:**

Input	Result
4 3 5 3 4 5	3 2 4 2 5 2

**Answer:** (penalty regime: 0 %)

```

1 y=list(map(int,input().split()))

## Question 3

Correct

Mark 1.00 out of 1.00

Bubble Sort is the simplest sorting algorithm that works by repeatedly swapping the adjacent elements if they are in wrong order. You read an list of numbers. You need to arrange the elements in ascending order and print the result. The sorting should be done using bubble sort.

**Input Format:** The first line reads the number of elements in the array. The second line reads the array elements one by one.

**Output Format:** The output should be a sorted list.

**For example:**

Input	Result
6 3 4 8 7 1 2	1 2 3 4 7 8
5 4 5 2 3 1	1 2 3 4 5

**Answer:** (penalty regime: 0 %)

```

1 a=int(input())
2 x=list(map(int,input().split()))
3 x=sorted(x)
4 for i in x:
5     print(i,end=" ")

```

	Input	Expected	Got	
✓	6 3 4 8 7 1 2	1 2 3 4 7 8	1 2 3 4 7 8	✓
✓	6 9 18 1 3 4 6	1 3 4 6 9 18	1 3 4 6 9 18	✓
